

**In the Specification**

Please replace the paragraph beginning at page 10, line 8, with the following rewritten paragraph:

The seal (4) may suitably be of a flexible plastics material having a rim portion (4a) which can engage with the rim of the neck finish (2) so that the seal (4) is held in place in its shortened and expanded positions. Also concertina-like side walls (4a) can provide the expansion of the seal (4) into the neck finish (2). The sidewalls (4a) shown in FIGS. 4a and 4b have an accordion-fold configuration. They include parallel folds that expand and collapse like an accordion, as depicted in FIGS. 4a and 4b. Each fold runs in an opposite or reverse direction to an adjacent fold. The folds are shown as alternating. Each panel of the fold in the configuration shown in FIGS. 4a and 4b is approximately the same size as an adjacent panel. Typically the secondary seal (7) and the permanent cap (25) may also be of plastics material.
